

Motivation

One person cannot monitor the workpiece and other machine locations/functions at the same time.

The aim of the solution is to allow you to monitor multiple activities at the same time (all on one screen).

Description

The system allows to display the image from one or more cameras on the screen of the machine control panel. Furthermore, it is possible to control (rotating and zooming) the installed cameras located on any part of the machine, including the working area of the machine.

Benefits

- Detailed view of the cutting area without the need for access - increased operator safety
- Complete overview of the machining process on one screen
- Excellent overview of automated machine operations
- Improved efficiency of remote diagnostics
